

Why Is Space Black If There Are Billions of Stars?

Olbers' Paradox: shouldn't the sky be all light?

Light is fast — but not infinite

We only see the OBSERVABLE universe

Expanding space stretches light

Far light → redshifted → invisible to us

Space = vacuum, nothing to scatter light

**You see light only when it reaches your
eye**

**Space isn't truly empty — the CMB
glows!**

3 reasons → black sky

**The dark sky is proof of an expanding
universe**

Quick Brain Check! □ Pause & Think — 3

Questions

**1. Olbers' Paradox 2. Redshift 3. ~13.8
billion yrs**
