

How Do PLANES Stay in the Air?

4 Forces: Lift • Weight • Thrust • Drag

Wing shape = airfoil

Fast air = low pressure → LIFT

Push air down → wing pushed UP

**Engines blast air back → plane goes
forward**

Takeoff ~250-290 km/h

cruise ~900 km/h

Ailerons · Elevators · Rudder = steering

Flaps = more lift at slow speed

No engine? Planes can GLIDE

Quick Brain Check!

1.2.3 → PAUSE

**Answers: 4 Forces • Pressure Diff • Need
Speed**
