

Animals Around Us

Animals live everywhere around us: in homes, farms, forests, deserts, water, trees, and soil. Some animals are big, some are tiny, some walk, some fly, and some swim. Science helps us understand how animals live and stay safe.

Quick check: Name one habitat and one animal living there.

What Is a Habitat?

A habitat is the natural home of an animal. A good habitat gives food, water, shelter, and space. A fish needs water. A camel is suited to the desert. A bird needs a safe place to nest.

Quick check: Name one habitat and one animal living there.

Land Animals

Many animals live on land. Dogs, cows, lions, elephants, and ants are land animals. They use legs to walk, run, jump, or climb. Their body parts help them find food, escape danger, and take care of young ones.

Quick check: Name one habitat and one animal living there.

Water Animals

Fish, whales, crabs, frogs, and turtles spend much time in water. Fish breathe with gills and move using fins. Ducks have webbed feet that help them swim. Water animals have body parts suited to water life.

Quick check: Name one habitat and one animal living there.

Birds and Flight

Birds have feathers, wings, and beaks. Many birds can fly, but not all birds fly well. A bird uses its beak to pick food. Different birds have different beaks depending on what they eat.

Quick check: Name one habitat and one animal living there.

Insects Are Animals Too

Insects are small animals with six legs. Many insects have wings. Butterflies, ants, bees, and grasshoppers are insects. Some insects help plants by carrying pollen, while some may damage crops or spread disease.

Quick check: Name one habitat and one animal living there.

Animal Food Habits

Animals eat different kinds of food. Herbivores eat plants. Carnivores eat other animals. Omnivores eat both plants and animals. A cow is herbivore, a tiger is carnivore, and a bear is omnivore.

Quick check: Name one habitat and one animal living there.

Food Chains

A food chain shows how food energy moves. Grass is eaten by a grasshopper. A frog eats the grasshopper. A snake may eat the frog. Food chains remind us that living things are connected.

Quick check: Name one habitat and one animal living there.

Adaptations

An adaptation is a special feature or behavior that helps an animal survive. Camels store fat and can live with little water for some time. Ducks have webbed feet. Some animals use camouflage to hide.

Quick check: Name one habitat and one animal living there.

Animal Protection

Animals protect themselves in different ways. Some run fast, some hide, some have hard shells, and some move in groups. A turtle uses its shell. A deer runs fast. A porcupine has sharp quills.

Quick check: Name one habitat and one animal living there.

Care for Animals

Domestic animals depend on people for food, water, shelter, and care. We should be kind to animals and never tease or hurt them. Clean water, proper food, and a safe place keep animals healthy.

Quick check: Name one habitat and one animal living there.

Recap Quiz

Let us revise. What is a habitat? Name one water animal. What do herbivores eat? Give one animal adaptation. Why should we protect animal homes? Explaining these answers means your animal science foundation is strong.

Quick check: Name one habitat and one animal living there.
