

Why Does ICE FLOAT?

$$\text{DENSITY} = \frac{\text{MASS}}{\text{VOLUME}}$$

Most solids SINK... water FLOATS!

H₂O — Bent & POLAR

Hydrogen Bonds = molecule magnets

LIQUID: packed close = HIGH density

Below 0°C → bonds LOCK

ICE = open hexagon + EMPTY space

Ice 0.92 < Water 1.0 → FLOATS!

Water is DENSEST at 4°C

Ice = blanket → fish survive winter

Only 9% shows!

QUICK BRAIN CHECK — PAUSE!

ANSWERS: 0.92 g/cm³ • 4°C • 91%
