

How Do Batteries **STORE** Power?

Batteries store CHEMICAL energy — not electricity!

Anode (–)

Cathode (+)

**Oxidation gives electrons. Reduction
takes them. = REDOX**

**Electron flow through the wire =
ELECTRIC CURRENT**

**Outside: electrons. Inside: ions. One
complete loop!**

Voltage = the PUSH

AA = 1.5V

Primary = use once

Secondary = rechargeable

**Charging = running the reaction in
REVERSE**

Alessandro Volta built the first battery
— 1800

**Li-ions shuttle: graphite anode ↔
metal-oxide cathode**

Capacity = mAh

Quick Brain Check! 1) Chemical or electrical? 2) Oxidation: which electrode? 3) Which is rechargeable?

**1) Chemical 2) Anode (oxidation) 3)
Secondary (rechargeable)**

**Recap done! NEXT: Why do onions make
you cry?**
