

How Does a Microwave Heat Food?

Invisible waves made by a MAGNETRON

Water = a tiny magnet (polar molecule)

Field flips ~2.45 billion times/sec!

Friction → HEAT

No water = no heating

Heats ~1.5 cm deep, then spreads

Turntable = even heating

**Mesh keeps waves in. No metal, no
sealed eggs!**

**Invented by accident (1945, Percy
Spencer)**

Waves + molecule dance = hot food

Quick Brain Check! □ Pause & Think — 3

Questions

**1. Water molecules 2. Friction → heat 3.
Even heating**
