

Why Does Soda FLIZZ?

Bubbles = Carbon Dioxide (CO₂)

High PRESSURE + COLD = gas dissolves
in

**Sealed bottle = gas HIDDEN under
pressure**

**Open it → pressure DROPS → gas
escapes!**

Bubbles are born at NUCLEATION SITES

**Mentos = THOUSANDS of nucleation
sites → FOUNTAIN!**

Left open = gas escapes = FLAT soda

**Same physics: sparkling water, fizzy
meds... even divers!**

Carbonate → seal → open → DROP →
fizz!

1) Which gas + process? 2) Why gas escapes on open? 3) Bubble birth spots?

- 1) CO₂ / carbonation**
- 2) Pressure drops**
- 3) Nucleation sites**
