

Why Can You See **THROUGH** Glass?

Light = Energy Wave

Absorb · Reflect · Transmit

**Electrons jump ONLY with the exact
energy**

Big energy gap → light passes through

Opaque = light absorbed, can't pass

Glass = clear to visible, blocks most UV

Why glass = mirror at night

Light slows → bends = Refraction

Glass = frozen liquid (amorphous)

Rough surface → scatters light = blurry

Quick Brain Check!

1.2.3 → PAUSE

**Answers: Energy Gap · 4% Reflection ·
Scattering**
