

EP01 — How does AI like ChatGPT actually work?

ENGLISH

01 Title

How does AI like ChatGPT **actually** work? You use it almost every day — but what's really happening inside? Today, let's open the box. No hype, no jargon.

[CUE] Hold on the title ~2s, calm confident tone, then go.

02 The Hook

You type "I am going ho..." and your phone guesses "home". That tiny guess? That is the **entire secret** behind ChatGPT — just scaled up a **billion** times. Stick around for five minutes and this "magic" will completely make sense.

[CUE] Energy up here — this is the hook. Tap your phone mime on "guesses home".

03 Today's question

So here is today's one question: how does it **decide** what to say next — and does it actually **know** things, or is it just guessing? Let's find out.

[CUE] Slow down. Let the question land before moving on.

04 Idea 1 — Prediction machine

Idea number one: ChatGPT is a **prediction machine**. Give it "The cat sat on the blank", and it does **not** look up an answer in a database. It simply predicts the most **likely** next word. "Mat"? Very likely. "Banana"? Almost never. It picks the top one, adds it, and predicts again.

[CUE] Reveal the probability bars one by one as you say mat / floor / sofa / banana.

05 Idea 2 — Trained on text

But how does it know "mat" is likely and "banana" isn't? Because it trained on a **massive** amount of text — billions of sentences from books, websites, conversations, and code. It did not memorise facts like a list. It absorbed the **patterns** of language — like a student who read millions of pages and just learned how sentences flow.

[CUE] Reveal the chips (books, websites, code) as you list them.

06 Idea 3 — One token at a time

Here's the part that surprises people: it builds an answer **one piece at a time**. Each little piece is called a **token**. It predicts one token, adds it to the sentence, then feeds the whole thing back in to predict the next. "The... sky... looks... blue... because..." — one token at a time, incredibly fast.

[CUE] Reveal the token chain left-to-right; read it with a steady rhythm.

07 Idea 4 — Context / attention

Now, how does it stay on topic? It **weighs every word** you wrote. If you say "I left my phone in the car, can you help me find it?" — it works out that "phone" and "car" matter most for the answer, not "the" or "my". This idea — paying **attention** to context — is literally what made modern AI work.

[CUE] Point to "phone" and "car" highlights as you say them.

08 Why it matters

And that's the beautiful part. This one simple idea — predict the next token — scales up to almost **anything**. The same trick writes an essay, debugs code, drafts an email, answers a question. But never forget: it is **predicting, not understanding**.

[CUE] Land hard on "predicting, not understanding" — this sets up the myth.

09 Common myth

Which brings us to the biggest myth. People think ChatGPT **knows** the truth and looks it up. It doesn't. It predicts the most likely-sounding words. So it can be completely confident — and completely **wrong**. We call that a **hallucination**. So always **verify** anything important.

[CUE] Reveal the green "Reality" card after a short beat on the myth.

10 Recap

Quick recap. One: AI like ChatGPT is just **next-word prediction**, at a massive scale. Two: it doesn't think or know — it **guesses patterns**. So use it, but check the facts that matter.

[CUE] Crisp and clear — these are the two lines people should remember.

11 CTA

And that's it — you now understand the magic that most people don't. If this made AI **click** for you, subscribe to Katixo KhojLab. Next question: what is an algorithm? I'll explain it with a samosa queue. See you there.

[CUE] Warm, friendly. Smile in your voice on the subscribe line.
